

A strong build with a deliberate AI boundary

WealthCopy is not an AI financial adviser. It is a deterministic structure engine with a tightly bounded explanation orchestrator.

PROVEN

Working end to end

- Public no-login deployment
- L1 through terminal L15
- Eight-group structure report
- Safety-first routing

BOUNDED

Model authority

- Four allowlisted IDs
- Categorical signals only
- Server-owned final copy
- Exact fallback parity

HONEST

Claim discipline

- Internal review ranges
- No return forecast
- No product recommendation
- No population-rank claim

JUDGE TAKEAWAY

Financial facts never depend on model output.

The model changes how verified facts are introduced and connected, while level thresholds, gaps, safety conditions, composition values, priorities, and all final Korean sentences remain server-owned. This division is both the product's technical differentiator and its main safety control.

One strict path from household input to report

The financial engine runs before any model call. The model receives a minimized planning context, never the underlying financial snapshot.

Data minimization is an architectural boundary

The design protects sensitive household numbers by shrinking model authority and model visibility at the same time.

Control map

Request abuse	8 KiB stream cap, JSON-only, origin gate, bounded in-memory limiter
Prompt injection	Raw note excluded; all model fields treated as data; IDs only
Invalid model output	Strict schema plus context allowlists; reject whole plan
Retention	No financial browser persistence; no-store; OpenAI store:false
Deployment secret	Google Secret Manager; non-root runtime; ignored env files

The model selects interpretation, not financial truth

A valid orchestration plan changes the executive framing and route reading order without changing any number, risk or priority.

DETERMINISTIC
Financial facts and safety

- Level thresholds and next-band gap
- Composition values and reference ranges
- Cashflow, liquidity and debt checks
- Priority content and final Korean copy
- Fallback response schema

MODEL-SELECTED
Four explanation decisions

- Overall framing
- Lead insight and executive headline
- Diagnosis / adjustment / checkpoint order
- Connection from evidence to route

VALID PLAN FROM THE AUTOMATED EVALUATION		
FRAMING	cashflow_then_gap	Sets the explanatory lens
LEAD INSIGHT	balance_before_scale	Changes the executive opening
EXPLANATION ORDER	adjustment_first	Changes each route-stage introduction
CONNECTION	structure_to_gap	Links the diagnosis to the remaining gap

FALLBACK PARITY

Null, partial, invented, extra-field or context-disallowed plans are rejected as a whole. Missing key, timeout, rate limit and API error preserve the same wealth-report-v2 shape.

Normal progression and safety gates

Each scenario separates the deterministic product outcome from the optional explanation-orchestration policy.

01 Normal L6 to L7

INPUT CONDITION

KRW 440M assets and KRW 40M debt. Home is 63.6% of assets; monthly balance is positive.

DETERMINISTIC RESULT

L6, 50% inside the band, KRW 100M to L7. Home is 13.6 percentage points above the L7 internal ceiling. Three priorities and three horizons are produced.

ORCHESTRATION POLICY

Framing may be `structure_then_scale` or `cashflow_then_gap`. Lead, explanation order and connection each come from context-specific allowlists.

MODEL CALL: YES

02 Monthly deficit

INPUT CONDITION

Essential living expense plus debt payment exceeds monthly after-tax income.

DETERMINISTIC RESULT

Monthly balance becomes negative while deployable amount stays zero. The first horizon moves safety conditions ahead of any composition guidance.

ORCHESTRATION POLICY

Fixed `protect_then_build` / `safety_is_the_gate` / `diagnosis_first` / `safety_to_structure`.

MODEL CALL: NO

03 High debt burden

INPUT CONDITION

High debt service, short liquid runway, high debt-to-assets and weak net worth occur together.

DETERMINISTIC RESULT

Every critical condition appears together in the first horizon. Later structural work is explicitly conditional on all safety stops being resolved.

ORCHESTRATION POLICY

The same fixed safety plan is used. No model call can reorder or soften a critical safeguard.

MODEL CALL: NO

Uncertainty, recovery and terminal wealth

The same response contract covers incomplete holdings, negative net worth and the terminal KRW 1T+ band without inventing promotion claims.

04 Low-confidence input

INPUT CONDITION

The other / expected-recovery asset group exceeds 10% of total assets.

DETERMINISTIC RESULT

Confidence becomes low and structural ranking is held until holdings are clarified. The report still returns exactly three bounded priorities.

ORCHESTRATION POLICY

Fixed verify_then_plan / certainty_before_comparison / checkpoint_first / evidence_to_priority.

MODEL CALL: NO

05 L1 recovery

INPUT CONDITION

Total assets are below total debt, producing negative net worth.

DETERMINISTIC RESULT

The report classifies L1 and prioritizes deficit recovery, liquidity defense and debt stabilization instead of investment expansion.

ORCHESTRATION POLICY

The negative-net-worth hard stop disables orchestration. The server-owned recovery sequence cannot be reordered or softened.

MODEL CALL: NO

06 L15 terminal

INPUT CONDITION

Net worth is KRW 1T or more.

DETERMINISTIC RESULT

Current and next both remain L15; gap is zero. No L16, promotion or arrival-time claim appears. The route focuses on durability, liquidity, concentration, governance and succession.

ORCHESTRATION POLICY

The same strict contract applies, but all server-owned terminal copy prevents a fabricated higher band.

MODEL CALL: CONDITIONAL

Build, test and live deployment evidence

The final quality gate, production dependency audit and live Cloud Run checks were completed against the submission build.

QUALITY GATE	FINAL RESULT
ESLint	PASS - zero warnings
TypeScript	PASS
Automated tests	54 passed across 10 files
Production build	PASS - Next.js standalone
Production dependency audit	No known vulnerabilities
Boundary coverage	All 15 levels / all 8 groups / safety and model fallback

RECENT ERROR LOGS

LIVE PRODUCT EVIDENCE

Live concentrated L6 to L7: KRW 100M gap / 8 rows / 3 priorities / 3 stages / no-store.

Submission-ready prototype, not production financial advice

The project is intentionally explicit about what its data and controls do not yet establish.

REFERENCE VALIDITY

Composition ranges are WealthCopy-owned internal policies, not observed Korean household averages, official percentiles, optimal allocations or return forecasts.

BACKDATA BOUNDARY

External household research calibrates only server-side distribution shape. US-dollar figures and source terms are not exposed or converted for users.

UPPER-BAND DEPTH

Governance and succession guidance needs ownership, entity and readiness inputs before production use.

ABUSE AND IDENTITY

The limiter is in memory and the demo has no authentication. Distributed controls are required before sustained public use.

DATA LIFECYCLE

Customer snapshot persistence remains disabled pending retention, deletion, legal, privacy and accessibility review.

PRODUCTION PATH

- Validate internal ranges with Korean household and adviser research.
- Add explicit ownership, entity and readiness inputs for upper bands.
- Replace in-memory limiting with authenticated distributed controls.
- Complete accessibility, privacy, retention and financial/legal review before storing data.

FASTEST JUDGE PATH

Try the concentrated L6 sample - no login required

Open the live app, choose the sample, advance through the three input steps, and create the report. Expected: L6 to L7, 50% position, KRW 100M gap, home concentration above the internal ceiling, three priorities and three route horizons.
